

Developer Setup Instructions

Step 1: Clone the Repositories

1. Clone the Frontend Repository

- Open your terminal and run the following command:
`git clone https://github.com/Fiti-git/FI-IHR-F-next`
`cd FI-IHR-F-next`

2. Clone the Backend Repository

- Open a new terminal window and run the following command:
`git clone https://github.com/Fiti-git/FI-IHR-B`
`cd FI-IHR-B`

Step 2: Set Up the Frontend (Node.js)

1. Install Node.js dependencies

- Make sure you have Node.js installed.
Check with:
`node -v`
`npm -v`
- If Node.js is not installed, download it from <https://nodejs.org>

2. Install Dependencies

- In the frontend directory (FI-IHR-F-next), run:
`npm install`

3. Run the Development Server

- Start the frontend dev server:
`npm run dev`
- The frontend should be available at:
`http://localhost:3000`

Step 3: Set Up the Backend (Django)

1. Install Python 3.10+

- Make sure you have Python 3.10 or higher installed.
Check with:
`python3 --version`
- If Python is not installed, download it from <https://www.python.org>

2. Install PostgreSQL 17

- Download and install PostgreSQL 17 from:
<https://www.postgresql.org/download/>
- Make sure PostgreSQL is running on `localhost:5432`

3. Set Up a Virtual Environment

- Navigate to the backend directory (FI-IHR-B):
`python3 -m venv venv`
- Activate the virtual environment:
 - macOS/Linux:
`source venv/bin/activate`
 - Windows:
`venv\Scripts\activate`

4. Install Backend Dependencies

- Inside the virtual environment, run:
`pip install -r requirements.txt`

5. Set Up the Database

- In the backend `settings.py`, ensure the database settings match:

```
DATABASES = {  
    'default': {  
        'ENGINE': 'django.db.backends.postgresql',  
        'NAME': 'IHRDB',  
        'USER': 'postgres',  
        'PASSWORD': 'postgres',  
        'HOST': 'localhost',  
        'PORT': '5432',  
    }  
}
```

6. Create the Database

- Open PostgreSQL terminal:

```
psql -U postgres
```

- Run:

```
CREATE DATABASE IHRDB;
```

7. Run Migrations

- Navigate to the backend project folder and run:

```
python manage.py migrate
```

8. Create a Superuser (Optional)

- Run:

```
python manage.py createsuperuser
```

9. Run the Backend Server

- Run:

```
python manage.py runserver
```

- The backend should be available at:

```
http://localhost:8000
```

Step 4: Test Push to GitHub

1. Set Up Git Configuration

- Make sure Git is configured with your user info:
`git config --global user.name "Your Name"`
`git config --global user.email "youremail@example.com"`

2. Make a Test Change

- Modify any file (e.g., add a comment) to test the push.

3. Commit and Push

- Run the following:
`git add .`
`git commit -m "Test commit"`
`git push origin main` # Or replace 'main' with master

4. Verify the Push

- Go to GitHub and confirm your changes appear in the repository.

Final Notes:

Ensure you have all necessary permissions for the repositories on GitHub.

Check your GitHub account for repository invite links and **accept the invitations** to gain access.

If you encounter issues with migrations, try clearing and rerunning them.
